CASE STUDY: MOTLEY FOOL

Problem:

The customer needed testing to be conducted on a new version of a component of their web. My portfolio 2.0 was a component of the U.S. version of The Motley Fool web site and the U.K. version of the site which function was to allow its users to track stocks that they owned. The new version of My Portfolio, My Portfolio 2.0, had improved functionality and design structure. At The Motley Fool, the QA department was relatively new and was overwhelmed with a large demand in testing.

Pointe Solution:

Pointe Technology Group approached this challenge by reviewing requirements, conducting meetings with developers and management and customizing Pointe's four step methodology and process to best meet the Motley Fool's needs. Pointe Technology reviewed the requirements and approached the application with a high-level test strategy where testing issues, standards and resources were outlined.
